# LaTeX mathematics cheat sheet

🕒 10 minute read

[LaTeX](#) is the de facto standard typesetting system for scientific writing. A lot of the nice looking equations you see in books and all around the web are written using LaTeX commands. Knowing a few of the mathematics commands is not only helpful if you want to write a book or an article (or do some [extreme stuff](#)), but can come in handy in a lot of places, as many systems support LaTeX. You can use LaTeX in [MathJax](#) to display expressions on the web (like here), you can make yourself good looking mathematics flashcards in [Anki](#), you can even nerd out and send formulas built with LaTeX commands to your friends via an [iMessage app](#). Also, Apple's latest Pages release now supports LaTeX equations.

Reasons enough to get familiar with the standard commands!

While a lot of commands can be written out in plain (e.g.  $1+1=2$ ), there are other frequently used commands you will need to look up or memorise.

I plan to update this post continuously as I find myself looking for a common symbol I haven't listed yet. Feel free to drop me an email or comment when you land here and don't find the answer to a frequently used symbol.

Here is the cheat sheet (naturally incomplete):

## Fractions

Command	Description	Output
---------	-------------	--------

Command	Description	Output
<code>\frac</code>	Build a fraction like so: <code>\frac{1}{2}</code>	$\frac{1}{2}$
<code>\frac{\frac{}}{}}</code>	You can nest fractions: <code>\frac{\frac{1}{2}}{2}</code>	$\frac{\frac{1}{2}}{2}$

## Greek letters

(capitalize by capitalizing the command)

Command	Description	Output
<code>\alpha</code>	alpha	$\alpha$
<code>\beta</code>	beta	$\beta$
<code>\gamma</code>	gamma	$\gamma$
<code>\delta</code>	delta	$\delta$
<code>\epsilon</code>	epsilon	$\epsilon$
<code>\zeta</code>	zeta	$\zeta$
<code>\eta</code>	eta	$\eta$

Command	Description	Output
<code>\theta</code>	theta	$\theta$
<code>\iota</code>	iota	$\iota$
<code>\kappa</code>	kappa	$\kappa$
<code>\lambda</code>	lambda	$\lambda$
<code>\mu</code>	mu	$\mu$
<code>\nu</code>	nu	$\nu$
<code>\xi</code>	xi	$\xi$
<code>o</code>	omicron	$o$
<code>\pi</code>	pi	$\pi$
<code>\rho</code>	rho	$\rho$
<code>\sigma</code>	sigma	$\sigma$
<code>\tau</code>	tau	$\tau$

Command	Description	Output
<code>\upsilon</code>	upsilon	$\upsilon$
<code>\phi</code>	phi	$\phi$
<code>\chi</code>	chi	$\chi$
<code>\psi</code>	psi	$\psi$
<code>\omega</code>	omega	$\omega$

## Logic

Command	Description	Output
<code>\forall</code>	For all	$\forall$
<code>\exists</code>	Exists	$\exists$
<code>\vee</code>	Or	$\vee$
<code>\wedge</code>	And	$\wedge$
<code>\veebar</code>	Xor	$\underline{\vee}$

Command	Description	Output
<code>\neg</code>	Not	$\neg$

## Operators

Command	Description	Output
<code>\times</code>	Times	$\times$
<code>\cdot</code>	Dot	$\cdot$
<code>\div</code>	Division	$\div$
<code>\pm</code>	Plus minus	$\pm$

## Relation

Command	Description	Output
<code>\neq</code>	Not equal	$\neq$
<code>\approx</code>	Approximately equal	$\approx$
<code>\leq</code>	Less than or equal	$\leq$

Command	Description	Output
<code>\geq</code>	Greater than or equal	$\geq$
<code>\ll</code>	Much less than	$\ll$
<code>\gg</code>	Much greater than	$\gg$

## Sets

(Often you can put an “n” before the command and get the negation)

Command	Description	Output
<code>\supset</code>	Proper superset	$\supset$
<code>\supseteq</code>	Superset	$\supseteq$
<code>\subset</code>	Proper Subset	$\subset$
<code>\subseteq</code>	Subset	$\subseteq$
<code>\in</code>	Member	$\in$
<code>\emptyset</code>	Empty set	$\emptyset$

Command	Description	Output
<code>\mathbb{R}</code>	Set of real numbers	$\mathbb{R}$
<code>\cup</code>	Set union (belonging to A OR B)	$\cup$
<code>\cap</code>	Set intersection (belonging to A AND B)	$\cap$

## Super-/Subscript (Exponents / Indices)

Command	Description	Output
<code>^</code>	Use <code>^</code> for superscript. Example: <code>x^2</code>	$x^2$
<code>^{}</code>	Use <code>^{}</code> for exponents with >1 digit. Example: <code>x^{10}</code>	$x^{10}$
<code>_</code>	Use <code>_</code> for subscript. Example: <code>x_0</code>	$x_0$
<code>_{}</code>	Use <code>_{}</code> for subscript with >1 digit. Example: <code>x_{10}</code>	$x_{10}$

## Others

Command	Description	Output
<code>\infty</code>	Infinity	$\infty$

Command	Description	Output
<code>\partial</code>	Partial	$\partial$
<code>\hat{}</code>	Estimator	$\hat{\theta}$
<code>\sqrt[root]{}</code>	Square root	$\sqrt[3]{4}$

One small thing want to comment here for future readers, if you are working on a project with your friend(s) using LaTeX, you might be interested in using the online sharelatex website. Here's the link <https://www.sharelatex.com/>  
It's kind of like google doc. You can also compile your latex file and preview your document online.
